	there were many cases of typhoid among the typhoid Since	.∠	25X
6.	there were many cases of typhoid among the workers due to the primitive, open wells frequented, constant water analysis was necessary, as well as required immunization of the employees. This medical center with 50 beds was separate from all other medical services in Latvia, for the benefit of the railroad employees alone, who, on the basis of socialized medicine, paid only one-third of was well staffed by 15 doctors; it had its own X-ray, surgical, internal medicine and other specialized departments: Its laboratory was ably run by a woman, centers for emergency treatment of employees were located in every major urban was underway. Also, this medical center constantly sent doctors and nurses these doctors was very high. In confunction with our work as the Dail	2	25x
	In conjunction with our work at the Railroad Medical Center, we made periodic reports to State and University of Riga officials on our findings. In turn, the Center made available to the same authorities any contributions to medical research they came across in the normal persuit of their work, although these were limited to such items as emergency treatment of scalds, surface wounds, broken bones, and the like; other than this, no cash support was made to medical research.
